**DETAILED ACTION**

***Claim Rejections - 35 USC § 112***

1. The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

2. **Claims 1-12** are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

Independent claim 1 recites a module consisting of an RC circuit. It is not clear exactly what the RC circuit would contain. For the purpose of examination, the examiner assumes the term 'consisting' is changed to 'comprising'.

***Claim Rejections - 35 USC § 102***

3. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

4. **Claims 1,10-15** are rejected under 35 U.S.C. 102(e) as being anticipated by Bareis (6724890).

As per **claims 1,10-15**, Bareis discloses an impedance matcher for an xdsl line that adaptively varies the applied impedance in view of changing connections to the networked line (abstract). The system inherently comprises a jack in order to couple the modem to the network line. Bareis discloses that the device may be implemented in any part of the network, or distributed throughout the network (Col 2 lines 55-65). The device will adapt to the presence or absence of an attached modem (or any other device) and adjust the impedance accordingly. The impedance that is inserted when the modem is absent will be made transparent when the modem is present because the device is continuously adapting the impedance to the current conditions.

***Claim Rejections - 35 USC § 103***

5. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

6. **Claims 2-9** are rejected under 35 U.S.C. 103(a) as being unpatentable over Bareis (6724890) as applied to claim 1 above, and further in view of Sticia et al. (US 20050232300 A1).

As per **claim 2-9**, Bareis discloses an impedance matching function but does not disclose the specifics of the device.

Sticia discloses an adaptive impedance for a dsl loop comprising various combinations of variable capacitors (varactors), resistors and inductors (para. 34). It would have been obvious to one of ordinary skill in the art at the time of this application to use known adaptive components such as various known combinations of R,C and L circuits, including varactors as a matter of design choice for the purpose of creating the matching impedance.

The examiner suggests a detailed claim amendment to the independent claims specifying the complete structure of Fig. 6.
